

## *TPS Software - 4 axis stabilization*

### **P/N SIGC-TPS-4A**

#### **TPS Software - 4 axis stabilization**

Temporal Processing System software provides daytime and nighttime real-time video enhancement; multiple axis stabilization contains extensive networking and security features and works with all video input types. TPS penetrates fog, haze and mirage artifacts; it suppresses image jitter introduced by camera vibration and produces excellent imagery at distances up to 50km when integrated with long-range optics. The operator has full control over the process and can enhance night vision clarity, color and can reduce noise substantially. This software provides 4-axis stabilization for a single sensor optics.
